

INTERNSHIP PROJECT DOCUMENTATION

IBM – Agentic AI Internship

Project Title

Enforcing Mandatory Fields Using UI Policies and Migrating Changes With Update Sets

Project Domain: ServiceNow / IT Service Management

Project Type: Internship Project

Submitted as part of the Internship Project Submission

1. PROJECT OVERVIEW

1.1 Project Title

Enforcing Mandatory Fields Using UI Policies and Migrating Changes With Update Sets

1.2 Problem Statement

In ServiceNow applications, certain fields are essential for maintaining complete and accurate records. If users submit forms without entering important information, incomplete records may be created. This can affect data quality, reporting, workflow processing, and overall system efficiency.

1.3 Brief Description of the Project

This project focuses on configuring ServiceNow forms so that important fields become mandatory when specific conditions are satisfied. UI Policies are used to control field behavior without requiring complex scripting. The project also demonstrates the use of Update Sets for capturing configuration changes and moving those changes between ServiceNow environments.

2. OBJECTIVES & PROPOSED SOLUTION

2.1 Project Objectives

- Understand the basic configuration capabilities of ServiceNow.
- Enforce mandatory fields using UI Policies.
- Improve data completeness and accuracy.
- Reduce incomplete records.
- Understand conditional field behavior.
- Learn how ServiceNow configuration changes are captured.
- Use Update Sets for migrating configuration changes.
- Understand the development-to-testing migration process.

2.2 Proposed Solution

The proposed solution uses ServiceNow UI Policies to dynamically control the behavior of fields on forms. When a specified condition is satisfied, the selected field becomes mandatory. The configuration changes are then captured using an Update Set so they can be transferred to a target environment.

2.3 How the Solution Works

- Access the ServiceNow instance and select the required table/form.
- Identify the field that must become mandatory.
- Create a UI Policy and define the required condition.
- Configure the UI Policy Action to make the selected field mandatory.
- Test the form under different conditions.
- Capture the configuration changes in an Update Set.
- Complete the Update Set after development and testing.
- Transfer the configuration to the target environment and verify it.

2.4 Key Features

- **Dynamic Mandatory Fields:** Fields can become mandatory according to configured conditions.
- **Configuration-Based Approach:** The solution uses ServiceNow configuration features.
- **Improved Data Quality:** Required fields help ensure important information is available.
- **Update Set Migration:** Configuration changes can be grouped and transferred.
- **Maintainability:** The configuration can be modified for future requirements.

3. IMPLEMENTATION & RESULTS

3.1 Technologies and Tools Used

- ServiceNow
- UI Policies
- UI Policy Actions
- Update Sets
- ServiceNow Tables and Forms
- Web Browser
- GitHub for project documentation/reference where applicable

3.2 Working Process

Step 1 – Accessing ServiceNow: Open the ServiceNow development environment and select the required application/table.

Step 2 – Identifying the Required Field: Select an important field that should be mandatory under a defined condition.

Step 3 – Creating a UI Policy: Create a UI Policy for the required table.

Step 4 – Defining the Condition: Configure the condition that determines when the policy applies.

Step 5 – Configuring UI Policy Action: Select the field and enable its mandatory property.

Step 6 – Testing: Test the form when the condition is both true and false.

Step 7 – Creating an Update Set: Capture the configuration changes in the appropriate Update Set.

Step 8 – Completing the Update Set: Complete the Update Set after the configuration is tested.

Step 9 – Migration: Transfer the completed configuration changes to the target environment.

Step 10 – Verification: Test the migrated configuration and confirm the expected field behavior.

3.3 System Workflow

1	Open ServiceNow form
2	Check configured condition
3	UI Policy is triggered when condition is satisfied
4	Required field becomes mandatory
5	User enters required information
6	Configuration is captured in Update Set
7	Update Set is completed and migrated
8	Target environment is tested

3.4 Screenshots / Output

Screenshot 1: ServiceNow application/dashboard — *Insert the actual project screenshot here.*

Screenshot 2: Selected table/form — *Insert the actual project screenshot here.*

Screenshot 3: UI Policy creation and condition — *Insert the actual project screenshot here.*

Screenshot 4: UI Policy Action showing mandatory configuration — *Insert the actual project screenshot here.*

Screenshot 5: Form showing mandatory-field behavior — *Insert the actual project screenshot here.*

Screenshot 6: Update Set and captured configuration changes — *Insert the actual project screenshot here.*

Screenshot 7: Completed Update Set / migration screen — *Insert the actual project screenshot here.*

3.5 Results Achieved

- Required fields can be controlled dynamically.
- Users are guided to provide important information.
- Incomplete records can be reduced.
- UI Policies provide a simple way to control field behavior.
- Configuration changes can be grouped using Update Sets.
- The project demonstrates the basic process of ServiceNow configuration migration.
- The solution improves consistency between development and target environments.

4. CONCLUSION & FUTURE SCOPE

4.1 Conclusion

The project “Enforcing Mandatory Fields Using UI Policies and Migrating Changes With Update Sets” demonstrates an effective approach for improving data quality and managing configuration changes in ServiceNow. UI Policies provide a convenient mechanism for controlling field behavior based on conditions. By making important fields mandatory when required, the system can encourage users to provide complete information. The project also provides an understanding of Update Sets and their role in transferring ServiceNow configuration changes between environments.

4.2 Challenges Faced

- Understanding and configuring the correct UI Policy conditions.
- Selecting and configuring the correct UI Policy Action.
- Testing the form under different conditions.
- Ensuring required configuration changes are captured in the correct Update Set.
- Verifying the configuration after migration.

4.3 Future Enhancements

- Introduce more complex conditions for multiple business scenarios.
- Control multiple fields using different UI Policies.
- Add additional validation rules.
- Introduce automated testing.
- Extend the solution to additional ServiceNow modules.
- Explore automated deployment and monitoring.
